

# Java Project Report 1

*Three of us had a group meeting on Friday 31.05. During that meeting, we talked about the features that we wanted our app to have and the general structure. here are the personal reports :*

## **Aida :**

I and Lea worked on the self-test with open NLP and later I improved the code and created the project on github as v1.0. I also developed a better binary file for en-lemmatizer.bin using Nltk tools in Python. V1.0 : get a string from the user and get the sentences, tokens, posTags and lemmas.

## **Lea :**

we worked on the openNLP self-test as I mentioned before we. currently, she is working on the design of UI for the program.

## **KaiYi:**

After our meeting on Friday, he did some organisation regarding to group work - creating and managing the google sheet. he also worked on V1.1 of the program. so this version : instead of getting an string from user, he added a helper method for reading a txt file from input and save the data as string and then do the things I mentioned in V1.0 on it.

## **Daniyal:**
